KEYMACRO is a powerful macro recorder for

Apple Mac OS X and allows users to record up to 200 keystrokes or key presses with text/command from the Mac OS X 10.3 through 10.9 and macOS. Sometimes we want to know where a certain program is installed. We can also view the list of all software applications and set the default programs. OS X 10.10 Yosemite supports symbolic links, but since it wasn't there from the beginning, I've added a way to create them. My solution uses nothing but Apple's API. This is great for those who want to try it out, but would want to avoid spending money. The advantage is that you can create symbolic links even on Windows. The idea of a symbolic link is to take a directory, for example the

directory with games, and create a shortcut to a file. When you move the directory or rename it, the shortcut stays the same. The disadvantage is that the original folder and the shortcut are not one directory deep anymore. If you want to go back you need to create another link. The trick is that the target is simply a file, not a directory. In the example, “~/Library/Application Support/Steam/SteamApps/common/Counter-Strike: Global Offensive” would be the directory, and “~/Library/Application Support/Steam/SteamApps/common/Counter-Strike: Global Offensive/csg_linux.cfg” would be the file. In Linux symbolic links are also supported, but they are only supported for directories. You’re

already in the macOS's console by using the Terminal application. # ls -l
