I want to interface a micro controller (MSP430FR5969) with an Arduino Uno without using a transistor. When I removed the MSP430FR5969 header pins (Vdd, Gnd, ICSP) and put them directly on the Arduino headers I was not able to get it to work since it won't put the device in standby mode. Is it possible to interface an MSP430FR5969 on an Arduino without using a transistor? If so, how do I go about this? A: I've tried to do this before, and had been able to, but I had only ever tried with an LT1184 linear voltage regulator. For some reason the flyback diode used for linear voltage regulation is not effective with the internal switching regulator in most Arduino boards (though it is on some of them). When I tested a few MCUs from several different manufacturers, none of them would power up or power down without a flyback diode. Also the ICSP connector on MSP430 boards has a resistance of about 5k ohms. The flyback diode of a linear voltage regulator has a cathode resistance about 3x
