The present invention relates to a circuit arrangement for providing a load current to a receiver circuit, the receiver circuit comprising at least one switch element through which the load current can be fed to a load, and comprising a control element for controlling the switch element. The purpose of the invention is to provide a circuit arrangement of the above kind which is not only able to control a load current by means of control currents but is also inexpensive and simple in construction and operation. This purpose is obtained in the circuit arrangement according to the invention in that the control element comprises a transistor and a reference voltage circuit connected to the base of the transistor. In a preferred embodiment of the circuit arrangement according to the invention the transistor is a bipolar transistor, and a series connection of a first resistor and a second resistor is connected in the base circuit of the transistor. The first resistor is connected to the collector of the transistor and to a first switch element, while the second resistor is connected to a second switch element, so that if both first and second switch elements are connected to the receiver circuit, the transistor is controlled as a function of a reference voltage and a differential signal present between the first and second resistor connected to the base circuit. In a further preferred embodiment of the circuit arrangement according to the invention, an LED is connected in series with the first switch element. The circuit arrangement according to the invention is particularly suitable for providing small step signals to 6d1f23a050
